

Lab04

1. What is the value of SQLAlchemy?

SQLAlchemy enables programmers to use a unified set of commands to interact with different relational databases. It is a Python abstraction and it facilitates the communication between Python programs and databases.

2. What is a model?

It is a set of data models with useful classes like Post, LikePost, Story, etc. It helps us to interact with the databases and commit new changes.

3. What is a view?

It is a defined endpoint with a List and Detail resource. It can create, read, update, and delete existing models like Post.
